

Devvio to demonstrate green blockchain solutions for ESG and smart cities during CES 2022

Demonstrations to include an all-in-one enterprise ESG platform and a comprehensive solution for Scope 3 emissions reporting

Albuquerque, New Mexico, December 29, 2021 — Devvio, Inc., a leading provider of enterprise blockchain solutions, will offer live demonstrations of its DevvESG product suite for environmental sustainability, social impact, and corporate governance (ESG) and smart cities during the 2022 Consumer Electronics Show in Las Vegas, booth 9371. Visitors to the booth will be eligible to receive a code which can be redeemed for a complimentary ESG report for their organization or business.

Built on the world's greenest blockchain, called DevvX, the DevvESG product suite is designed to motivate and simplify ESG efforts, accurately tracking and validating related assets and data—including carbon offsets, plastic offsets, and social good-related tokens—while bringing the entire ESG ecosystem onto a single platform. The company's products enable participant organizations to track their ESG performance and ratings with transparency, while making it easy and straightforward to discover novel ways to improve those ratings and securely report their efforts to key stakeholders. Participant organizations can also use DevvESG to engage their supply chain, employees, or constituents to encourage action and gather critical ESG-related data that typically goes unreported.

Product and platform features to be demonstrated at the show:

- Straightforward dashboards providing guidance on current ESG performance as well as suggestions for improving performance
- Step-by-step project development wizard to help create and design custom ESG initiatives
- The plastic village concept, designed to enable the circular economy and reduce the homeless population
- Tools for supply chain, employee, and constituent engagement

Devvio's DevvX blockchain, the fastest and most scalable in existence at over 8 million transactions per second, is based on nearly 5 years of R&D and has been deployed in a number of real-world enterprise systems. It offers immutability, privacy, Byzantine Fault Tolerance, theft and loss protections, and a RESTful API interface for straightforward integration into existing systems. The greenest blockchain platform on the market, DevvX would consume less than 1/1,000,000th of the energy consumed by Bitcoin during the execution of similar operations, based on an analysis of the environmental impact of proof-of-work protocols.
